

Clockify time tracking in Claude

Install the **clockify-mcp** plugin (NumacoAG/clockify-mcp, v0.4.x). Works in both the Claude desktop app and Claude Code in the terminal. Each colleague authenticates with their own Clockify API key — your key is encrypted inside your own access token; the shared server never stores it.

Step 1 — Get your Clockify API key

Open **clockify.me** → profile → Preferences → Advanced → API → click **Generate**, then copy the key. Keep it handy for step 3.

Step 2 — Install the plugin

Mac desktop app: click **Customize** in the sidebar → the + next to *Personal plugins* → **Create plugin** → **Add marketplace**. Paste NumacoAG/clockify-mcp → **Add**. Open the new marketplace in the sidebar → click **Install** on the *clockify-mcp* card.

Terminal (Claude Code): type these two slash commands in a session:

```
/plugin marketplace add NumacoAG/clockify-mcp
/plugin install clockify-mcp@clockify-marketplace
```

After install, fully restart Claude (Cmd+Q + reopen for the Mac app, or exit the session and start a new one in the terminal). The MCP server only wires in on a fresh session.

Step 3 — Authorise Clockify

Paste this prompt into Claude:

What are my Clockify projects?

Claude opens an authorisation URL in your browser. Paste your Clockify API key in the *Connect Clockify* form, click **Authorize**. You're in.

Step 4 — Install the Numaco billing rules (one-time)

Paste this prompt into Claude. It will show you the resulting file and wait for your confirmation before writing.

Append the following block to my ~/.claude/CLAUDE.md (create the file if it doesn't exist). Show me the proposed final content first and wait for my explicit 'yes' before writing.

```
## Clockify time-tracking – Numaco billing policy
```

These rules extend the clockify-mcp plugin's universal rules (15-min quantum, single entry <= 2h, never double-book the same customer) with Numaco-specific overlap behaviour.

- Cross-customer overlap is allowed. Parallel sessions for different customers may overlap in wall-clock time -- each is billed to its own project.
- Same-customer overlap is forbidden. Two entries on the same customer (whether same project or two projects under the same client) must not overlap.
- Internal Numaco syncs to skip when reconciling the calendar against Clockify: all-hands, Operations sync, Sales sync, AI labeling internal, 1:1s with Marco / Damiano.
- Project mapping cheat-sheet (attendee domain or subject keyword -> Clockify project):
 - @sandoz.com, @labvantage.com, keywords oneLIMS / Planica / Mexico / DEHO / MALZ -> OneLims-PolandLabels.
 - @novartis.com, keywords Artwork / GiSC / Codesoft / AW topics, organiser Kishore -> Artwork Novartis (AW workflow) or GiSC support TOQIT (Codesoft / GiSC integration).
 - @syngenta.com, keywords MALZ / Bartender -> MALZ support;

Uncountable -> Uncountable; GPD -> GPD.

Step 5 — Try it

Pick any of these prompts depending on what you want to do:

Log this session to Clockify.

Scan my calendar – what haven't I logged this week?

Set up a daily Clockify reconciliation sweep.

Sync my Clockify projects with the cheat-sheet in my CLAUDE.md.

What it does for you

- **Nudges you every ~20 min** in long coding sessions: *"want me to log this?"*.
- **/log-session** — proposes duration, project, description; you confirm.
- **/clockify-gaps** — reconciles your Outlook calendar against Clockify and proposes missing entries.
- **/clockify-schedule-daily** — creates a daily cron that drafts (does not send) an email with the day's missing entries.
- **/clockify-sync-mappings** — walks you through adding cheat-sheet rules for any new Clockify project (always asks before writing to your CLAUDE.md).
- **Universal rules baked in:** 15-min quantised entries (15m, 30m, 45m, 1h, ...), single entry $\leq 2h$, never double-books the same customer.
