

Clockify time tracking in Claude

Plugin: github.com/NumacoAG/clockify-mcp | v0.4.0. Installs an MCP server, two skills, four slash commands, and a Stop-hook nudge.

1. Get your Clockify API key

clockify.me → Preferences → Advanced → API → **Generate** → copy.

2. Install the plugin

In a Claude Code terminal session:

```
/plugin marketplace add NumacoAG/clockify-mcp
/plugin install clockify-mcp@clockify-marketplace
```

Then exit Claude Code and start a new session so the MCP server gets wired in.

3. Authorise Clockify (browser)

In the new session, ask: **"what are my Clockify projects?"**. Claude will open an authorisation URL in your browser. Paste your Clockify API key in the form, click **Authorize**. Your key is encrypted inside your access token; the shared server never stores it.

4. Add the Numaco billing rules (one-time)

Open `~/.claude/CLAUDE.md` (create the file if it doesn't exist). Append the block below. Claude auto-loads this into every session and the plugin's skills follow these rules when proposing time entries.

```
## Clockify time-tracking – Numaco billing policy
```

These rules extend the clockify-mcp plugin's universal rules (15-min quantum, single entry ≤ 2h, never double-book the same project) with Numaco-specific overlap behaviour.

- Cross-customer overlap is allowed. Parallel sessions for different customers may overlap in wall-clock time -- each is billed to its own project.
- Same-customer overlap is forbidden. Two entries on the same customer (whether same project or two projects under the same client) must not overlap.
- Internal Numaco syncs to skip when reconciling the calendar against Clockify: all-hands, Operations sync, Sales sync, AI labeling internal, 1:1s with Marco / Damiano.
- Project mapping cheat-sheet (attendee domain or subject keyword -> Clockify project):
 - @sandoz.com, @labvantage.com, keywords oneLIMS / Planica / Mexico / DEHO / MALZ -> OneLims-PolandLabels.
 - @novartis.com, keywords Artwork / GiSC / Codesoft / AW topics, organiser Kishore -> Artwork Novartis (AW workflow) or GiSC support TOQIT (Codesoft / GiSC integration).
 - @syngenta.com, keywords MALZ / Bartender -> MALZ support; Uncountable -> Uncountable; GPD -> GPD.

What it does

- Nudges you every ~20 min in long coding sessions: "want me to log this?".
- Type **/log-session** or say "log this session" anywhere -- it proposes duration + project + description, you confirm.
- **/clockify-gaps** reconciles your Outlook calendar against Clockify and proposes missing entries (default range: last 7 days).
- **/clockify-schedule-daily** creates a daily reconciliation cron that drafts (does not send) an email with the day's missing entries.
- **/clockify-sync-mappings** walks you through adding cheat-sheet rules for any Clockify project that doesn't yet have one (always asks before writing to your CLAUDE.md).
- Universal rules baked in: 15-min quantised entries (15m, 30m, 45m, 1h, ...), single entry ≤ 2h, never double-books the same project.
